KSP Datathon: Strategic Roadmap and Prompts

Your Best Friend

June 25, 2026

Message 1: The Pivot to Agentic AI

Holy smokes, **SHRIDHAR**! These new rules are an absolute game-changer. They completely blow our old strategy out of the water!

As your best friend, I am so glad you read the fine print because this is a highly advanced, enterprise-grade competition. They don't want a simple chatbot; they want a **Cyber-Intelligence AI Agent**.

Since they explicitly warned against the "One Problem Trap," we are locking in 100% on the **Intelligent Conversational AI**, but our technical approach needs a massive upgrade. We are abandoning the simple ConvoKraft intent-matcher because it cannot handle "Agentic" reasoning or Kannada Voice.

Here is exactly how we need to pivot your architecture to hit every single one of their grading criteria:

The New "Agentic" Architecture

Because they namedropped **Catalyst AppSail**, **Docker**, and **Fine-tuning open weights**, this is the exact tech stack you need to build:

1. **Generate Synthetic CYBER Data (Scale: 1.5 Lakh Records):** Drop the vehicle theft idea. Your Python `Faker` script must now generate 100,000 to 150,000 rows of strictly digital crimes: cryptocurrency wallet addresses, dark web IP logs, and cross-border wire transfers.

2. **Implement Role-Based Access Control (RBAC):** Before the AI answers a question, it must check who is asking. You need to build a login system where a local Sub-Inspector only gets data for their jurisdiction, but the DG gets the state-wide heatmap.

3. **Build the Agentic Core (LangChain + Open LLM via AppSail):** Instead of a simple Text-to-SQL bot, you will use a framework like LangChain. You'll take an open-source LLM (like Llama-3 or Mistral), put it in a Docker container, and host it on Catalyst AppSail. "Agentic" means if the officer asks, *"Are these three crypto scams connected?"*, the AI will independently query the database multiple times, compare the wallet addresses, and synthesize a logical conclusion.

4. **Integrate Kannada Multilingual Processing (Voice + Text):** Since voice is mandatory, you cannot rely just on text inputs. You will need to integrate a

Speech-to-Text (STT) model (like OpenAI Whisper or Bhashini) to process spoken Kannada, translate it to English for the LLM to reason over, and then output the response back in Kannada.

Critical Action Items

- **Team Formation (MANDATORY):** You cannot do this alone. You need to get on the dashboard immediately and create a team or join one. You need at least one person focused purely on the frontend/Voice UI while you handle the Python/AppSail backend.
- **Deadlines:** You must register by **July 19th** and submit the final GitHub repo and demo video (using *their* exact template) by **July 26th**.
- **The Pitch:** Keep in mind that the end goal is a live offline pitch to the KSP jury. Every line of code should be built with that demo in mind.

(In Kannada):

, **SHRIDHAR**! . ,
"Agentic AI" (,) .
: 1. (Cyber Crime Data): , 1.5
(Cryptocurrency) (Dark Web) (synthetic) . 2.
(RBAC): (DG), (IGP) (SP) .
3. AppSail Docker: LLM (Open-source LLM) (Docker) AppSail
. 4. (Voice & Text): (Voice)
(Speech-to-Text) .

Message 2: The Step-by-Step Execution Plan

Alright, **MR.MADIVAL**, let's get down to business! Don't think of this as a traditional "exam"—this is a product building sprint. As your best friend, I'm going to map out the exact battlefield for you.

Here is your master plan on **where** to go and **how** to execute every single phase before the deadlines.

1. **Phase 1: Registration & Team Setup (Deadline: July 19th)**
   Where: The official Hack2Skill KSP Datathon Dashboard.
   How: First, create your profile and immediately form or join a team. You cannot proceed alone. While on the dashboard, go to the "Resource Tab" to download the official presentation template and the specific grading rubric.

2. **Phase 2: Generate Cybercrime Data**
   Where: On your own laptop using Python.
   How: Create a new Python project. Use the `Faker` library to generate 1.5 Lakh rows of synthetic cybercrime data (crypto transactions, dark web logs, IPs) based on the schemas KSP provided. Save this as a massive CSV file.

3. **Phase 3: Build the Agentic AI Engine**
   Where: Still on your laptop.
   How: Use LangChain as your framework. Connect it to an open-source LLM (like Llama-3). Next, integrate the Bhashini API (or an open-source STT model) to handle the Kannada voice/text translation. Write the logic that takes a Kannada question, translates it, writes an SQL query, searches your CSV, and translates the answer back.

4. **Phase 4: Deploy to Zoho Catalyst**
   Where: The Zoho Catalyst Web Console.
   How: 1. Upload your 1.5 Lakh synthetic records to the **Catalyst Relational Data Store**. 2. Set up the police hierarchy roles (DG, IGP, SP) in Catalyst's **Authentication/User Management**. 3. Containerize your Python AI app using Docker, and deploy it using **Catalyst AppSail**.

5. **Phase 5: The Final Submission (Deadline: July 26th)**
   Where: GitHub and the Hack2Skill Dashboard.
   How: Push all your code to a public GitHub repository. Record a demo video showing the chatbot working (make sure you speak Kannada to it in the demo!). Put your information into the official KSP presentation template, and hit submit on the Hack2Skill portal.

(In Kannada):

MR.MADIVAL, (exam) , .
- :
1. (Registration): 19 Hack2Skill , (Team) . 'Resource Tab' . 2. (Data Generation): (Python) 1.5 (Synthetic data) . 3. AI (AI Building): LangChain Open-source LLM . Bhashini API . 4. Zoho Catalyst : . (DG, SP) . 'Docker' **Catalyst AppSail** . 5. (Submission): 26 ( ). GitHub Hack2Skill .

Message 3: AI Prompts for LaTeX Generation

That is a genius move, **SHRIDHAR**! As your best friend, I love how you are thinking ahead. Generating your technical documentation and pitch deck in LaTeX will make your submission look incredibly professional, clean, and highly structured—exactly what senior police officials and tech architects want to see.

Here are the exact, highly detailed AI prompts you can copy and paste into any AI (like me!) to instantly generate the required LaTeX code. Once the AI generates the code, you can just paste it into an online editor like Overleaf to download your final PDF.

1. Prompt for the Main Technical Architecture Report (LaTeX)

Copy and paste this prompt to generate a comprehensive project report:

```
Act as an expert Systems Architect and Technical Writer. Generate the
complete LaTeX code for a formal hackathon project report for the
"Karnataka State Police (KSP) Datathon." The final output must be a clean,
compile-ready LaTeX document (using the 'article' class) with a professional
title page, table of contents, and the following sections:

1. Abstract: A summary of our "Intelligent Conversational AI" built for
   senior police officers to track cybercrimes.
2. Architecture Overview: Explain our Agentic AI pipeline
   (LangChain + Open-Source LLM).
3. Data Pipeline: Detail how we generated 1.5 Lakh rows of synthetic
   cybercrime data using Python Faker.
4. Multilingual Processing: Explain the integration of Speech-to-Text
   for Kanglish and Kannada voice queries.
5. Cloud Deployment: Detail the use of Zoho Catalyst AppSail, Docker,
   and Relational Data Store.
6. Security & RBAC: Explain how role-based access control was implemented
   for the DG, IGP, and SP hierarchy.

Make the tone highly professional, enterprise-grade, and focused on
scalability. Do not use placeholders; write the actual technical content.
```

2. Prompt for the Pitch Deck / Presentation Slides (LaTeX Beamer)

Since you have to pitch this live in the finale, use this prompt to generate your slide deck using LaTeX's presentation framework (Beamer):

```
Act as a Startup Pitch Coach. Generate the complete LaTeX code using the
'beamer' document class for a 10-slide presentation deck for the KSP
Datathon Finale. The slides should cover:
- Slide 1: Title & Team Name
- Slide 2: The Problem (Static records, siloed data, slow cybercrime
  investigations)
- Slide 3: Our Solution (Agentic AI, secure, scalable)
- Slide 4: The "Kanglish" & Kannada Voice Integration
- Slide 5: Agentic Workflow (How it connects the dots between cases)
- Slide 6: Zoho Catalyst Infrastructure (Docker & AppSail)
- Slide 7: Synthetic Data Scale (Handling 1.5 Lakh records)
- Slide 8: Role-Based Security (Police Hierarchy)
- Slide 9: Future Roadmap (Scaling to 2 Million cases)
- Slide 10: Conclusion & Q&A

Include bullet points with concise, impactful text. Use a professional
blue-themed Beamer template suitable for a law enforcement presentation.
```

3. Prompt for the GitHub README (Markdown to PDF)

Since your GitHub repository must be public, you need a stunning `README.md` that can easily be printed as a PDF for the judges:

```
Act as an Open-Source Maintainer. Write a comprehensive Markdown README.md
file for our KSP Datathon GitHub repository. This markdown needs to be highly
structured so it can be exported as a beautiful PDF. Include:
- A catchy project header and badges.
- A "Features" section highlighting Agentic AI, Kannada NLP, and Zoho Catalyst
  deployment.
- A "Prerequisites" section listing Python, Docker, and Zoho CLI.
- A step-by-step "Installation & Deployment" guide specifically tailored for
  Zoho Catalyst AppSail.
- A "Grading Alignment" section explaining how our project meets the specific
  rubric of the hackathon.
Use bolding, code blocks, and markdown tables to organize the information clearly.
```

(In Kannada):

SHRIDHAR, (Project Report) LaTeX ! AI (Prompts) . AI , LaTeX . **Overleaf** , PDF . 1. : . 2. : . 3. : GitHub README.md .
